

CORONAVIRUS COVID-19 TESTS

Science 101

Dr Lidiya Angelova

QUICK TIP

Researchers simply removed the unwanted sequences from the samples, assembled what was left, and filled in the gaps. It isn't isolation.

CORONAVIRUS or SARS-CoV-2 is a mix of human and computer generated sequences and it was never isolated.

<https://genuineprospect.com/2022/02/13/what-is-coronavirus-or-sars-cov-2/>

SO, WHAT DO TESTS DETECT?

QUICK TIP

PCR is a technique that cannot determine whether or not a sample contains an infectious pathogen.

PCR tests detect small sequence reads (parts). The test kits aren't standardized. It means that results aren't reproducible. The threshold cycle (Ct) affects test sensitivity since as more cycles are performed, more copies from the genetic part are created. Laboratories run tests on Ct from 20-45. The same sample can test positive or negative depending on it. It also means that results from the tests aren't comparable.

SO, WHAT DO TESTS DETECT?

The PCR technique is not only complicated and requires highly trained personnel, but it is also extremely sensitive. The sample must be collected and the tests must be conducted in sterile conditions. In reality, none of it is done.

Labs should run the same samples at least three times to avoid random error. If at least two runs produce the same value, the result is valid. It isn't done too. The samples are only run once. It means that the outcome could be an error, which is quite likely given the reasons stated above.

The test results are not repeatable.

QUICK TIP

PCR is a technique that cannot determine whether or not a sample contains an infectious pathogen.

IMPORTANT FACTS ABOUT THE PCR TESTS

- The PCR test study is based on a bogus study conducted by Christian Drosten, the same man who created the first SARS-CoV. He has ties to Fauci and WHO. WHAT A FORTUNATE "COINCIDENCE"!!!
<https://cormandrostenreview.com/>
- Drosten stated in 2014 that his test can detect anything actually.
<https://www.nordkurier.de/politik-und-wirtschaft/die-haefte-aller-corona-positiven-ist-nicht-ansteckend-2241827212.html?fbclid=IwAR0volLrbDtyjDlfaGRejYQYdoqTRRdJhfNWkvucG5CdjndJw T-QVed58M>

SO, WHAT DO TESTS DETECT?

Antigen rapid tests should detect SARS-CoV-2 S (spike) protein. The S protein, on the other hand, was never purified and isolated. What you see in the pictures is generated by a computer. The "SARS-CoV-2" sequence can be found in extracellular vesicles. It means that antigen rapid tests detect vesicles that, coincidentally, resemble viruses.

SO, WHAT DO TESTS DETECT?

Antibody tests detect extracellular vesicles containing “SARS-CoV-2” sequence. It partially explains cross-immunity.

QUICK TIP

People who test positive despite being otherwise healthy provide further evidence that SARS-CoV-2 is a sequence in our genome.

CONCLUSION

- So called COVID-19 tests detect random sequences or extracellular vesicles. It is also confirmed by the fact that samples taken before the end of 2020 test positive. Animals also test positive, which is not unusual. Many animals share sequence parts with us.
- Since all COVID-19 test samples are only run once and under different conditions, COVID-19 testing lacks **reproducibility** and **repeatability**.
- The results from the tests aren't comparable as well.

Please Notice This

- The main issue with all COVID-19 tests is that, despite being proven unreliable, they are used to create bogus pandemic.
- When healthy people test positive, they are treated like vermin, and their basic human rights are violated.
- To go to school, work, or travel, you must take a test.
- People who test positive for COVID-19 and die are counted as COVID-19 deaths, even if they died from another cause.

COVID TESTS ARE USED TO PUSH THE FALSE PANDEMIC AND GOVERNMENTS KNOW IT

QUICK TIP

There isn't such a thing as COVID-19 symptoms. Everybody in the world who dies with any of those unreliable positive tests is counted as COVID-19 death.

This leads to a problem of classifying the numbers, as has existed since the beginning of the pandemic. Regardless of whether it is cancer, a car accident or actually COVID-19 pneumonia: the Robert Koch Institute (RKI) records everyone who tests positive as a COVID-19 case. Last year, an RKI spokeswoman told the author: On the one hand, people without COVID-19 symptoms would not have COVID-19; and completely symptom-free are not sick either. Why are they still listed as COVID-19 cases? Because, according to the spokeswoman at the time, this was international practice. In other words, because everyone does it.
