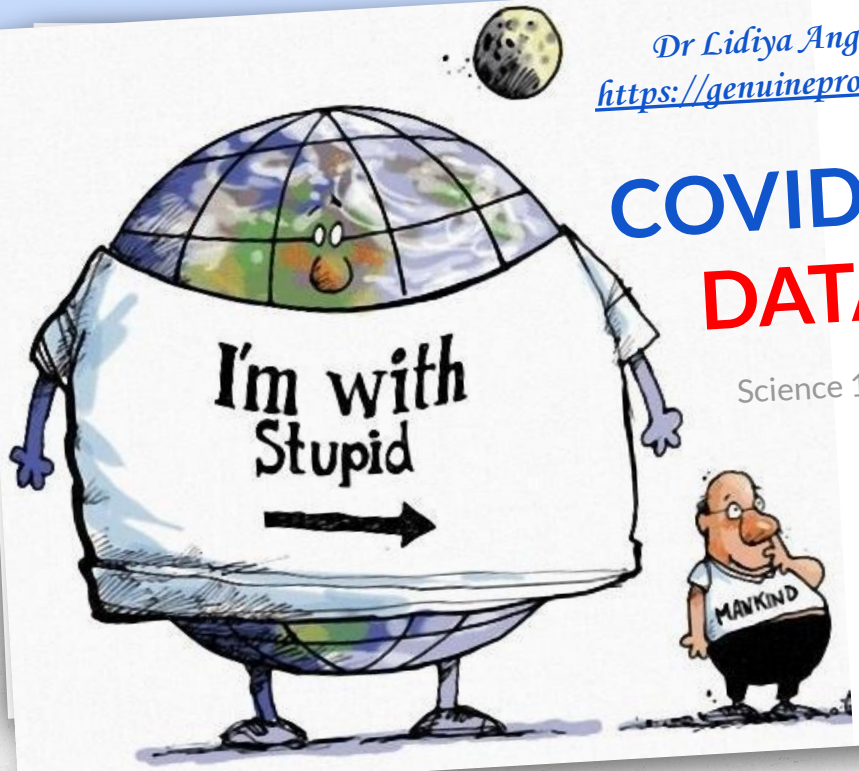
COVID-19 DATA

Science 101



People get respiratory infections every year, but for some reason in 2019, Chinese linked some of those infections to a virus. The virus is actually a sequence that matches SARS-CoV sequence, both made in the same way by removing unwanted sequences and filling in the gaps between by computer.

- China provided all of the original data for COVID-19. It was never **verified**.
- The symptoms of COVID-19 are the same as those of well-known common diseases.
- Pathogens that could cause the same symptoms were found in the samples of the initial "cases."

Despite all above, the WHO mandated the creation of math models based on inaccurate Chinese data. The predictions were never realized.

Nobody has yet been held accountable, despite the fact that measures like lockdowns and vaccines are killing and damaging millions of people and were simply unnecessary.

QUICK TIP

Professor Neil Ferguson has a history of producing inaccurate predictions, but he was selected to lead the math modeling team. This time, he used unreliable data as well.

COVID-19	Other diseases
Fever or chills	Flu Common cold Bacterial infections
Cough	Flu Common cold Bacterial infections
Shortness of breath or difficulty breathing	Flu Common cold Bacterial infections
Fatigue	Flu Common cold Bacterial infections
Muscle or body aches	Flu Common cold Bacterial infections
Headache	Flu Common cold Bacterial infections
Sore throat	Flu Common cold Bacterial infections
Congestion or runny nose	Flu Common cold Bacterial infections
Nausea or vomiting	Food-borne illnesses Stomach flu Heart attack Cancer Gastroparesis
Loss of taste or smell	Flu Common cold Hypertension Diabetes
Conjunctivitis	Flu Common cold Bacterial infections
Difficulty breathing or shortness of breath	Flu Common cold Bacterial infections
Chest pain or pressure	Coronary heart disease Heart attack Myocarditis (inflammation of the heart muscle) caused by various bacteria and viruses
Loss of speech or movement.	Stroke Migraine Neurological Disorders

COVID-19 “cases” are justified by the number of positive tests.

The PCR test cannot determine whether or not there is a virus in the sample. It shows a segment of a sequence. This test, as well as the **antigen** and **antibody** tests, are not **repeatable** or **reproducible**. It means that the data cannot be used to justify or draw any conclusions. **These tests, which demonstrate different things such as a fragment of a sequence, a possible viral protein, or an antibody, are all included in the same data.**

IT ALL MAKES THE COVID-19 STATISTICS ABSOLUTELY MEANINGLESS.

QUICK TIP

The SARS-CoV-2 PCR test was created by the same person who created the SARS-CoV sequence. His name is Christian Drosten.

WHAT ABOUT THE VACCINE DATA?

COVID-19 vaccination data is also unreliable.

- **The manufacturing process is accelerated, and vials can contain varying concentrations of components.**
- **It is frequently administered by people who have no medical training.**

It means that people receive different doses of the vaccines. Some people may have received a placebo.

The only certainty is that it is a gene therapy that harms and kills those who receive it.

CONCLUSION

COVID-19 pandemic is based on Chinese data which was never verified.
That data is used for math models which predictions are inaccurate.
All COVID-19 data is meaningless.

COVID TESTS ARE USED TO PUSH THE FALSE PANDEMIC AND GOVERNMENTS KNOW IT

QUICK TIP

There isn't such a thing as COVID-19 symptoms. Everybody in the world who dies with any of those unreliable positive tests is counted as COVID-19 death.

This leads to a problem of classifying the numbers, as has existed since the beginning of the pandemic. Regardless of whether it is cancer, a car accident or actually COVID-19 pneumonia: the Robert Koch Institute (RKI) records everyone who tests positive as a COVID-19 case. Last year, an RKI spokeswoman told the author: On the one hand, people without COVID-19 symptoms would not have COVID-19; and completely symptom-free are not sick either. Why are they still listed as COVID-19 cases? Because, according to the spokeswoman at the time, this was international practice. In other words, because everyone does it.

QUICK TIP

People who test positive despite being otherwise healthy provide further evidence that SARS-CoV-2 is a sequence in our genome.

- **So called COVID-19 tests detect random sequences or extracellular vesicles.**
  It is also confirmed by the fact that samples taken before the end of 2020 test positive. Animals also test positive, which is not unusual. Many animals share sequence parts with us.
- **Since all COVID-19 test samples are only run once and under different conditions, COVID-19 testing lacks reproducibility and repeatability.**
- **The results from the tests aren't comparable as well.**

- **The main issue with all COVID-19 tests is that, despite being proven unreliable, they are used to create bogus pandemic.**
- **When healthy people test positive, they are treated like vermin, and their basic human rights are violated.**
- **To go to school, work, or travel, you must take a test.**
- **People who test positive for COVID-19 and die are counted as COVID-19 deaths, even if they died from another cause.**

Sadly, I must fight the narrative and misinformation spread by those who claim to be against it. They simply amplify the narrative. I'm not sure if they're stupid and ignorant or a well-coordinated opposition, but **if someone says there's COVID-19 or SARS-CoV-2 or wants to analyze the data, that person either has no idea what they're talking about or deliberately spreads misinformation.**
